Study B attempt 3 | The 230-seat event at the 60-second function allowance

99 Emperor registrations (198 seats), 19 Merit and 13 Bodhi; 131 registration units; current preference order; execution 1 of each backend

Both maps are independently validated and proven optimal with the same production-scale penalty, but they are different physical maps: 65 of 131 registration units hold different seats, and the three preference penalties balance differently. Registration numbers identify placements, not preference quality.
